

Sec. 3.1Linear Approximations

to approximate a linear function to a given function  $f(x)$  at a given point

$$\textcircled{1} \quad y = f(c) + f'(c)(x-c)$$

Differentials

When  $\textcircled{1}$  is used as an approximation to the graph of  $f(x)$ ,  $x-c$  is called the change in  $x$ ,  $\Delta x$ . When  $\Delta x$  is small, the change in  $y$ ,  $\Delta y$ , can be approximated by  $\Delta y = f(x+\Delta x) - f(x)$   $\textcircled{2}$ .

$\Delta x$ , traditionally noted by  $dx$  is the differential of  $x$   
 $\textcircled{3} \quad dy = f'(x) dx$  is the differential of  $y$ . In many applications, the differential of  $y$  can be used to approximate the change in  $y$ .  $\Delta y \approx dy$  or  $\Delta y \approx f'(x) dx$ .

Error  $\frac{df}{f}$  is the relative error of a situation

$\frac{df}{f}(100)$  is the percentage error.

Approximating function values

$$\textcircled{4} \quad f(x+\Delta x) \approx f(x) + dy = f(x) + f'(x) dx$$

P.236

$$\begin{aligned} \textcircled{9} \quad y &= 1 - 2x^2 \quad x=0, \quad \Delta x = dx = -0.1 \\ \Delta y &= f(0-.1) - f(0) & dy &= -4x dx \\ \Delta y &= .98 - 1 & dy &= -4(0)(-.1) \\ \Delta y &= \underline{\underline{-.02}} & dy &= \underline{\underline{0}} \end{aligned}$$

$$\begin{aligned} \textcircled{11} \quad y &= 3x^2 - 4 \\ dy &= \underline{\underline{6x dx}} \end{aligned}$$

$$\begin{aligned} \textcircled{14} \quad y &= (x^2 - 4)^{1/2} \\ dy &= \frac{1}{2}(x^2 - 4)^{-1/2}(2x) dx \\ dy &= \underline{\underline{x(x^2 - 4)^{-1/2} dx}} \end{aligned}$$

$$\begin{aligned} \textcircled{18} \quad y &= x \sin x \\ dy &= \underline{\underline{(x \cos x + \sin x) dx}} \end{aligned}$$

$$\begin{aligned} \textcircled{22} \quad A &= \frac{1}{2}bh, \quad b = 36 \text{ cm}, \quad h = 50 \text{ cm} \\ db &= dh = \pm .25 \text{ cm} \end{aligned}$$

$$\Delta A \approx dA = \frac{1}{2}b dh + \frac{1}{2}h db$$

$$dA = \frac{1}{2}(36)(\pm .25) + \frac{1}{2}(50)(\pm .25)$$

$$dA = \pm 4.5 + \pm 6.25$$

$$dA = \underline{\underline{\pm 10.75 \text{ cm}^2}}$$

$$\textcircled{30} \quad V = \frac{4}{3}\pi r^3 \quad r = 1000 \text{ cm} \quad dr = .20 \text{ cm}$$

$$dV = 4\pi r^2 dr$$

$$dV = 4\pi (1000 \text{ cm})^2 (.20 \text{ cm})$$

$$dV = \underline{\underline{8000\pi \text{ cm}^3}}$$
